

TriageAI

Support Triage Agent — Complete Project Plan

Muhammad Yasir | mmyasir101@gmail.com | Andela Capstone 2026

PROJECT OVERVIEW

TriageAI is an AI-powered support ticket triage system that automatically classifies incoming tickets, routes them to the correct team queue, assigns priority levels, and drafts professional first responses — all powered by the Claude AI API.

7 Days	5 Tools	4 Phases	Claude AI
Timeline	Tech Stack	Build Phases	AI Engine

Phase 1Setup & PlanningDay 1

Step 1 — Environment Setup

- Install Node.js (v18+) and create Next.js project
- Set up Cursor IDE and connect to Claude API
- Get Claude API key from console.anthropic.com
- Create Airtable account and base for ticket queue
- Install n8n locally or sign up for n8n Cloud

Step 2 — Define Ticket Categories

- Billing issue → High priority → Billing team
- Bug / Technical → High priority → Engineering team
- Feature Request → Low priority → Product team
- General Query → Medium priority → General support

Phase 2Frontend BuildDay 2

Step 3 — Ticket Submission Form

- Build ticket form: Name, Email, Issue description fields
- Add Submit button with loading state
- Style with Tailwind CSS for clean, responsive layout
- Cursor prompt: 'Build a support ticket form in Next.js with Tailwind'

Step 4 — Claude API Integration

- Write triage prompt: classify category, assign priority, draft response
- Call Claude API from /api/triage endpoint
- Parse JSON response: category | priority | draft_response | routing
- Handle errors and edge cases gracefully

Step 5 — Backend API Route

- Create /api/triage POST endpoint in Next.js
- Validate input, call Claude, return structured result
- Add rate limiting and error handling

Step 6 — Save to Airtable

- Connect Airtable API to save each triaged ticket
- Fields: ticket ID, content, category, priority, draft, timestamp, status
- Build simple queue view to list all tickets

Step 7 — n8n Workflow Automation

- Trigger: new ticket submitted via webhook
- Action 1: Call Claude API for triage
- Action 2: Save result to Airtable
- Action 3: Send email notification to correct team

Step 8 — Results Dashboard

- Show triage result after submission: category, priority, draft
- Add ticket queue view with stats (total, high priority, open)
- Add copy-to-clipboard for draft responses

Step 9 — Test 5 Ticket Types

- 'My payment failed twice' → Billing / High
- 'App crashes on PDF upload' → Bug / High
- 'Can you add dark mode?' → Feature / Low
- 'How do I reset my password?' → General / Medium
- 'Invoice shows wrong amount' → Billing / High

Step 10 — Polish & Prepare

- Record 2-minute screen recording of the full flow
- Prepare 3–4 live test tickets for the demo
- Write 1-minute pitch: problem → solution → demo
- Deploy to Vercel for a live shareable URL

FULL TIMELINE

Day	Task	Deliverable
Day 1	Setup & planning	Dev environment ready
Day 2	Frontend ticket form	Working submission UI
Day 3	Claude AI integration	Triage API endpoint
Day 4	Airtable + n8n workflow	Automated queue routing
Day 5	Results dashboard	Full end-to-end flow
Day 6	Testing & polish	5 ticket types tested
Day 7	Demo prep & deployment	Live URL + screen recording

TECH STACK

Tool	Purpose	Why
Cursor IDE	Code writing	AI-assisted, fast development
Claude API	AI triage brain	Classification + response drafting
Next.js	Frontend + Backend	Full-stack, easy deployment
Airtable	Ticket storage	Free, visual, API-ready
n8n	Workflow automation	No-code routing + notifications
Tailwind CSS	Styling	Fast, responsive, clean UI
Vercel	Deployment	Free, instant CI/CD
